PVC BACKGROUND

A flexible, wear-resistant top layer with fashionable designs!

HUIYA accepts no liability whatsoever for any direct or indirect damage, from any kind, arising from the information on this product sheet

Top Layer

PVC top layer applied afterwards

A raised floor can also be retrofitted with PVC tiles.

These tiles are available in different sizes and designs. Because the PVC tile is made thicker (2mm-5 mm thickness), it is stable enough to permanently cover the seams of a computer floor. This is the top layer

suitable for retrofitting - in the work - over the raised floor. With the versatility of motifs and beautiful finishing possibilities, a fantastic end result can be created!

HUIYA combines the application of the tiles with the assembly of the raised floor. This ensures you an excellent end result, the risk of error is minimal and you only have one point of contact.

Finish Panel

PVC tiles have a different size compared to the raised floor panels. This means that the PVC tiles cover the seams of the raised floor
